

SegWAY® Carpal Tunnel Release

Carpal Tunnel Syndrome (CTS) is a condition that causes pain, tingling, numbness and other problems in your hand due to pressure on the nerves in your wrist. With traditional carpal tunnel release, surgeons must make a large incision at the bottom of the palm in order to manipulate the tendons and muscles in the wrist during surgery. Dr. Dougherty performs the innovative SegWAY® carpal tunnel that safely allows him to perform the surgical procedure through a smaller incision in the wrist. This results in less pain and tenderness after the surgery, and more rapid recovery of normal hand use- most within just a couple of days.
